

Chapter 3 Exercise 3

Car Models

Make a proper Launch screen with the program title and copyright info.

It is often found cars are defective after they have been manufactured, When this happens the manufacturer puts out an alert that the cars need to be recalled for service. This app will inform the car owner whether or not the car needs to go to the car dealer for service.

The cars to be recalled are 119, 117, 189 - 195, 221 and 780. If the user enters a number outside that range, display “The model number enter is not listed as needing service.” If it is one of the models listed display “Your car is defective. Please take it to a dealer for repairs.” Use a complex boolean expression to accomplish the task.

Remember the four steps. How many pieces of data must be gathered? You can use the exercises we did in class to review how to gather the data.

Be sure to handle the editing changed event to clear the display when the text field changes. Also do the view.endEditing on touchesBegin and when the price button is pressed.
