

Chapter 3 Exercise 2

Package

Make a proper Launch screen with the program title and copyright info.

A package delivery service accepts packages based on size and weight. If the package weighs more than 27 kilograms it is rejected as too heavy. If the package has a volume of more than 0.01 cubic meters (100,000 cubic centimeters), the package is rejected as too large. If both conditions are true the package is rejected as too large and too heavy. If none of the conditions are true, the package is accepted.

When the user enters the data and presses the Check Package button, the proper response is displayed:

Package Rejected: Too large
Package Rejected: Too heavy
Package Rejected: Too large and too heavy
or
Package Rejected: accepted.

Be sure to clear the display on any editing changed event. Also make sure valid input is done in each textfield.

The screenshot shows an iPhone 7 Plus screen with the title bar "iPhone 7 Plus - iOS 10.2 (14C89)". The app interface has a black background with green text. At the top, it says "Enter the package's data". Below this are four labels with corresponding text input fields: "Weight in killograms" (30), "Length in cenemeters" (60), "Height in cenemeters" (40), and "Width in cenemeters" (25). Below the inputs is a yellow button labeled "Check Package". At the bottom, the text "Package Rejected: Too heavy" is displayed in green.

Before you code, determine what the variables are on paper. How many input variables are there? Constants? How many output variables are there? How many optionals. What is the data type of each?

Remember the four steps. How many pieces of data must be gathered? You can use the exercises we did in class to review how to gather the data.
